

4.3. {6, 8, 22, 24, 32, 34}

4.3.6 Compute (a) the characteristic polynomial of A , (b) the eigenvalues of A , (c) a basis for each eigenspace of A , and (d) the algebraic and geometric multiplicity of each eigenvalue.

$$A = \begin{bmatrix} 1 & 0 & 2 \\ 3 & -1 & 3 \\ 2 & 0 & 1 \end{bmatrix}$$

■

4.3.8 Compute (a) the characteristic polynomial of A , (b) the eigenvalues of A , (c) a basis for each eigenspace of A , and (d) the algebraic and geometric multiplicity of each eigenvalue.

$$A = \begin{bmatrix} 1 & -1 & -1 \\ 0 & 2 & 0 \\ -1 & -1 & 1 \end{bmatrix}$$

■

4.3.22 If \mathbf{v} is an eigenvector of A with corresponding eigenvalue λ and c is a scalar, show that \mathbf{v} is an eigenvector of $A - cI$ with corresponding eigenvalue $\lambda - c$.

■

4.3.24 Let A and B be $n \times n$ matrices with eigenvalues λ and μ , respectively.

- (a) Give an example to show that $\lambda + \mu$ need not be an eigenvalue of $A + B$.
- (b) Give an example to show that $\lambda\mu$ need not be an eigenvalue of AB .
- (c) Suppose λ and μ correspond to the *same* eigenvector \mathbf{x} . Show that, in this case, $\lambda + \mu$ is an eigenvalue of $A + B$ and $\lambda\mu$ is an eigenvalue of AB .

■

4.3.32

- (a) Use mathematical induction to prove that, for $n \geq 2$, the companion matrix $C(p)$ of $p(x) = x^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0$ has characteristic polynomial $(-1)^n p(\lambda)$. [Hint: Expand by cofactors along the last column. You may find it helpful to introduce the polynomial $q(x) = (p(x) - a_0)/x$.]
- (b) Show that if λ is an eigenvalue of the companion matrix $C(p)$ in Equation (4), then an eigenvector corresponding to λ is given by

$$\begin{bmatrix} \lambda^{n-1} \\ \lambda^{n-2} \\ \vdots \\ \lambda \\ 1 \end{bmatrix}$$

■

4.3.34 Verify the Cayley-Hamilton Theorem for

$$A = \begin{bmatrix} 1 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 1 \end{bmatrix}$$

■
