Math 40 - Section — HW 9 - Eigenvalues and Eigenvectors Tuesday, February 23, 2016

4.3.{6, 8, 22, 24, 32, 34}

4.3.6 Compute (a) the characteristic polynomial of A, (b) the eigenvalues of A, (c) a basis for each eigenspace of A, and (d) the algebraic and geometric multiplicity of each eigenvalue.

$$A = \begin{bmatrix} 1 & 0 & 2 \\ 3 & -1 & 3 \\ 2 & 0 & 1 \end{bmatrix}$$

4.3.8 Compute (a) the characteristic polynomial of A, (b) the eigenvalues of A, (c) a basis for each eigenspace of A, and (d) the algebraic and geometric multiplicity of each eigenvalue.

$$A = \begin{bmatrix} 1 & -1 & -1 \\ 0 & 2 & 0 \\ -1 & -1 & 1 \end{bmatrix}$$

4.3.22 If **v** is an eigenvector of *A* with corresponding eigenvalue λ and *c* is a scalar, show that **v** is an eigenvector of A - cI with corresponding eigenvalue $\lambda - c$.

- **4.3.24** Let *A* and *B* be $n \times n$ matrices with eigenvalues λ and μ , respectively.
 - (a) Give an example to show that $\lambda + \mu$ need not be an eigenvalue of A + B.
 - (b) Give an example to show that $\lambda \mu$ need not be an eigenvalue of AB.
 - (c) Suppose λ and μ correspond to the *same* eigenvector \mathbf{x} . Show that, in this case, $\lambda + \mu$ is an eigenvalue of A + B and $\lambda \mu$ is an eigenvalue of AB.

4.3.32

- (a) Use mathematical induction to prove that, for $n \ge 2$, the companion matrix C(p) of $p(c) = x^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0$ has characteristic polynomial $(-1)^n p(\lambda)$. [*Hint*: Expand by cofactors along the last column. You may find it helpful to introduce the polynomial $q(x) = (p(x) a_0)/x$.]
- (b) Show that if λ is an eigenvalue of the companion matrix C(p) in Equation (4), then an eigenvector corresponding to λ is given by

$$\begin{bmatrix} \lambda^{n-1} \\ \lambda^{n-2} \\ \vdots \\ \lambda \\ 1 \end{bmatrix}$$

4.3.34 Verify the Cayley-Hamilton Theorem for

$$A = \begin{bmatrix} 1 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 1 \end{bmatrix}$$
